

Death Valley National Park California - Nevada

Hottest, Driest, Lowest

In this below-sea-level basin, steady drought and record summer heat make Death Valley a land of extremes. Yet, each extreme has a striking contrast. Towering peaks are frosted with winter snow. Rare rainstorms bring vast fields of wildflowers. Lush oases harbor tiny fish and refuge for wildlife and humans. Despite its morbid name, a great diversity of life survives in Death Valley.

Did You Know?

Death Valley is home to more than 1000 species of plants and more than 50 of those are endemics, found nowhere else in the world.
